

PE6201 End of Course Project Self Appraisal

HR Ask Policy Assistant | Kang Xingyao | G2604349F | Section C | 3 October 2026

This one page appraisal is aligned to the final project criteria. I assess the evidence I submitted, the limits of that evidence, and the next step required before any real deployment.

Final project criterion	My self appraisal and evidence
Problem statement and significance 15%	I defined one bounded user: a manufacturing team leader seeking fictional HR-policy guidance outside office hours. The intended output is a traceable answer or an unsubmitted five-field draft. I did not claim measured time savings or production readiness because the data and use case are fictional.
Business and technical trade offs 25%	I selected retrieval first, deterministic field validation and optional grounded LLM generation. This keeps policy evidence inspectable and prevents the model from submitting requests. The trade off is lower flexibility and only 5/8 complete drafts on the first turn. I separated low inference cost from human fallback and rule-maintenance assumptions.
Implementation, code and repository 35%	The repository contains versioned fictional policies, English module documentation, source code, a local web interface, labelled cases, regression tests, frozen results and a BPMN workflow. The implementation passed 30/30 engineering checks and produced valid five-field JSON in 8/8 ticket-intent cases. These are engineering results, not proof of independent HR-policy correctness.
Demonstration and communication 25%	My English demonstration shows my face and the working HR-Ask interface. It demonstrates consultation, a complete draft and missing-information handling, and explains why the system does not approve, submit or decide sensitive cases. The report and README give a reviewer a direct route to reproduce and inspect the work.

Reflection and next step

My strongest evidence is the transparent separation of structural checks, answer-quality review and cost assumptions. My main limitation is that the synthetic development cases are not an independent holdout and informal wording remains weak. Before any pilot, I would obtain HR review of a locked policy snapshot, test an independent set and add a guided multi-turn flow for missing fields.

Student confirmation

I have reviewed the submitted report, code, evidence and demonstration. I can explain the project scope, design choices, metrics, limitations and the role of each submitted artifact.
