

PE6201 End of Course Project Self Appraisal

HR Ask Policy Assistant | Kang Xingyao | G2604349F | Section C | 3 October 2026

Criterion	Weight	Excellent (4)	Proficient (3)	Developing (2)	Limited (1)
Problem statement and significance	15%	(X)	()	()	()
Business and technical trade offs	25%	(X)	()	()	()
Implementation, code and repository	35%	(X)	()	()	()
Demonstration and communication	25%	()	(X)	()	()

Evidence and reflection

Problem statement and significance. I defined one bounded user: a manufacturing team leader seeking fictional HR-policy guidance outside office hours. The output is a traceable answer or an unsubmitted five-field draft. I do not claim measured time savings or production readiness.

Business and technical trade offs. I chose retrieval first, deterministic field validation and optional grounded LLM generation. This keeps policy evidence inspectable and prevents the model from submitting requests. The trade off is lower flexibility and only 5/8 complete drafts on the first turn.

Implementation, code and repository. The repository contains versioned fictional policies, English module documentation, source code, a local interface, labelled cases, regression tests, frozen results and a BPMN workflow. It passed 30/30 engineering checks and produced valid five-field JSON in 8/8 ticket-intent cases. These results do not prove independent HR-policy correctness.

Demonstration and communication. My English demonstration shows my face and the working HR-Ask screen. It demonstrates consultation, a complete draft and missing-information handling. I rated this area proficient because the next version could use more concise delivery and independent user feedback.

Next step and confirmation: Before any pilot, I would obtain HR review of a locked policy snapshot, test an independent set and add a guided multi-turn flow for missing fields. I have reviewed the submitted report, code, evidence and demonstration and can explain the project scope, metrics, limitations and design choices.
